

Number of Trees per Acre by Spacing Distance

Dr. Kim D. Coder, Professor of Tree Biology & Health Care / University Hill Fellow
University of Georgia Warnell School of Forestry & Natural Resources

Many components of natural resource management, site and stand assessments, and community forest / tree density control all utilize the number of tree stems per acre as a quantitative measure. The number of trees per acre (tree density) depend upon distances between individual tree stems. To estimate the number of trees per acre, trees are assumed to be roughly on a grid spacing lay-out. Trees per acre are determined by measuring distance between trees averaged for the site. The distance between tree rows and the distance between trees within a row are estimated. In greenways, cemetaries, parks, and across landscapes tree numbers per acre can be estimated in a similar way as estimating plantation trees in grid lay-out.

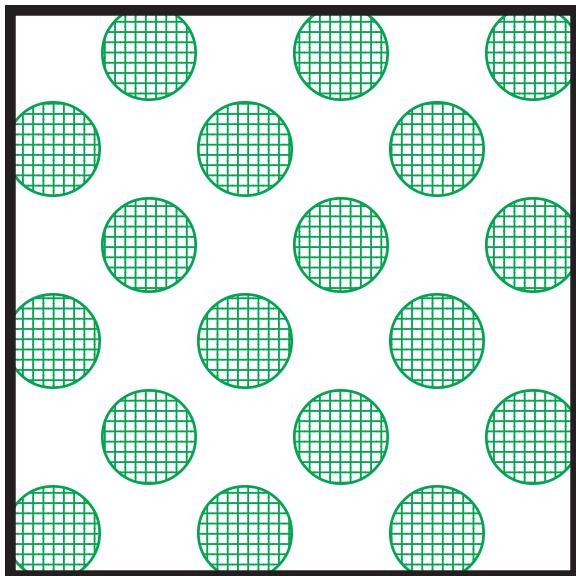

When planting a plantation or forest area, initial number of trees per acre are estimated by seedling spacing. With time, general forest management can use spacing between trees and number of trees per acre to estimate standing timber volume and value, help prescribe silvicultural treatments, and provide simple concepts of tracking forest growth dynamics. Figure 1 provides simple examples.

Below are presented two tables which show the number of trees per acre based upon tree spacing in two directions. The spacing distances are measured in feet. Table 1 provides the number of trees per acre when trees are planted, or are growing, in a grid, square, or at equal spacings. Table 2 is a large table broken into several parts which determine trees per acre for many combinations of spacings when distances between trees within rows and between rows vary. The formula for calculating trees per acre values within these tables is:

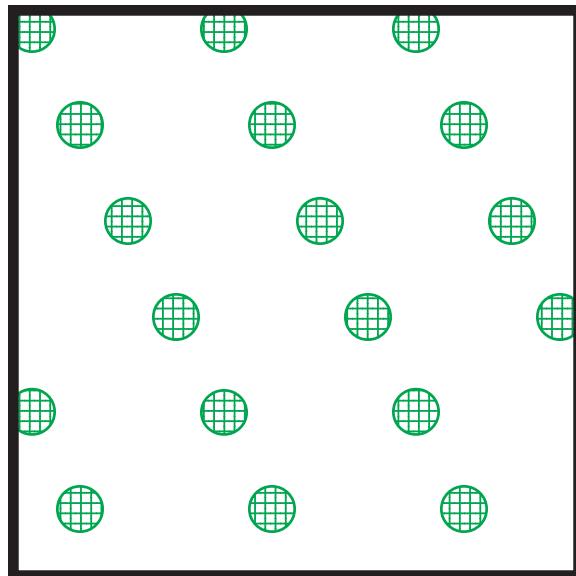

Estimated Number of Trees per Acre =

43,560 / [(spacing of trees in feet for direction 1) X (spacing of trees in feet for direction 2)].

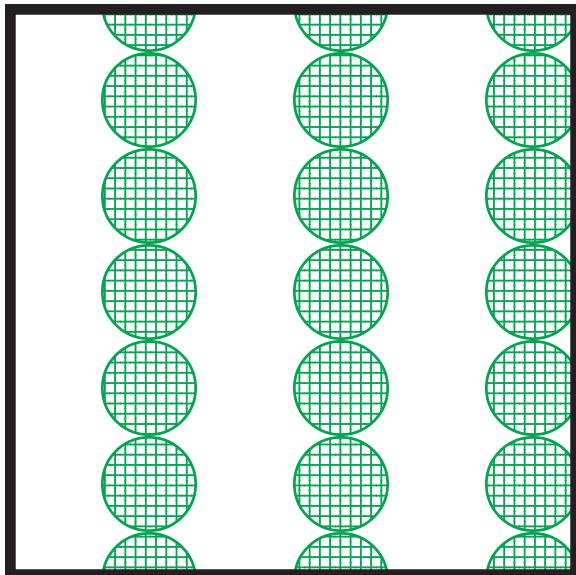

For example: If trees growing within a row are 9 feet apart and rows of trees are 9 feet apart, trees are growing at a 9 feet by 9 feet spacing (9×9), yielding approximately 538 trees per acre, if the spacing is consistent across the site (Table 1). If trees within a row are 20 feet apart and rows are 12 feet apart (12×20 or 20×12), trees are growing at a density of roughly 182 trees per acre (Table 2). Tree density on a site can be used to estimate interference / competition, reactions to site development and construction damage, shade management, and/or stem planting and removal estimates.

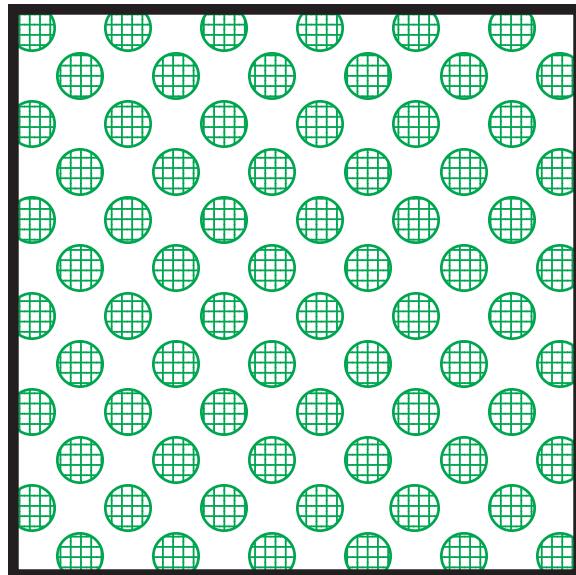

18 trees at ~49 X 49 ft spacing

18 trees at ~70 X 35 ft spacing

18 trees at ~70 X 35 ft spacing

72 trees at ~26 X 26 ft spacing

Figure 1: Simple examples of inter-tree spacing measured in feet as seen from above per acre..

Table 1: Approximate number of trees per acre based upon the distance in feet between stems in a square grid pattern.

spacing (feet)	number of trees / acre	spacing (feet)	number of trees / acre
1 X 1	43,560	30 X 30	48
2 X 2	10,890	35 X 35	36
3 X 3	4,840	40 X 40	27
4 X 4	2,723	45 X 45	22
5 X 5	1,742	50 X 50	17
6 X 6	1,210	55 X 55	14
7 X 7	889	60 X 60	12
8 X 8	681	65 X 65	10
9 X 9	538	70 X 70	9
10 X 10	436	75 X 75	8
11 X 11	360	80 X 80	7
12 X 12	303	85 X 85	6
13 X 13	258	90 X 90	5
14 X 14	222	95 X 95	5
15 X 15	194	100 X 100	4
16 X 16	170	110 X 110	4
17 X 17	151	120 X 120	3
18 X 18	134	130 X 130	3
19 X 19	121	140 X 140	2
20 X 20	109	150 X 150	2
21 X 21	99	160 X 160	2
22 X 22	90	170 X 170	2
23 X 23	82	180 X 180	1
24 X 24	76	190 X 190	1
25 X 25	70	200 X 200	1
